# Spring Security

In Spring Boot, `AuthenticationManager` is a core component of the Spring Security framework used for handling user authentication. It operates by processing authentication requests, which typically involve validating credentials such as usernames and passwords. Here's a breakdown of how it works and how it's configured:

In Spring Boot, an `AuthenticationProvider` is a component in Spring Security responsible for authenticating a user's credentials with custom logic. When a user attempts to authenticate, Spring Security's `AuthenticationManager` delegates to one or more `AuthenticationProvider` implementations to process and validate the credentials.
